

BrainRecovery Program

Our programs start with an assessment of over 293 dimensions of brain activity as it relates to emotions, regulation, and habitual cycles. The NeuroGeniSys Procedure identifies specific areas of the brain that need strengthening or balancing.

This program focuses on individuals who have cognitive function issues and may be recovering from injury, such as traumatic brain injury (TBI), post traumatic stress disorder (PTSD), severe depression, substance abuse, and/or other addictions.

- BrainRecovery improves brain capabilities and cognitive abilities.
- BrainRecovery combines therapeutic imprinting technologies for substance abuse that targets the triggers that lead to relapse.
- BrainRecovery focuses on balancing brain performance to pre-trauma function or better.

Each program starts the individual client at their current capabilities and encourages their recuperative edge.

- IQ
- Memory
- Job Function
- Head Trauma
- Depression
- Anxiety
- Addiction
- Stress
- Learning Challenges
- Acquired Personality Shifts
